

# Impact of Race and Tobacco Use on Birthweight by Week of Gestation

by Eric C. Tassone, J.D., Ph.D., Alan E. Gelfand, Ph.D., Geeta Swamy, M.D., & Marie Lynn Miranda, Ph.D.

- Focus on children
  - Focus on issues of environmental justice
    - Shift to preventive interventions
      - Emphasis on spatial analytic approaches

# Outline of Talk

- **Overview**
- **Data: North Carolina Detailed Birth Record Data**
- **Modeling Details**
- **Impact on Policy?**
- **Future Directions**

- **NC Detailed Birth Record**

- **Years 1999-2003, no congenital anomalies, firstborn singletons, no maternal alcohol use, at least 400g, and at least 26 weeks of gestation**

- **Maternal race:**

- **African American (non-Hispanic), ~22.4%;**

- **White (non-Hispanic), ~66.3%;**

- **or Hispanic, ~11.2%**

- **Overall, N=220,709**

# Weeks of Gestation by Birthweight

# Weeks of Gestation by Birthweight

# Weeks of Gestation by Birthweight

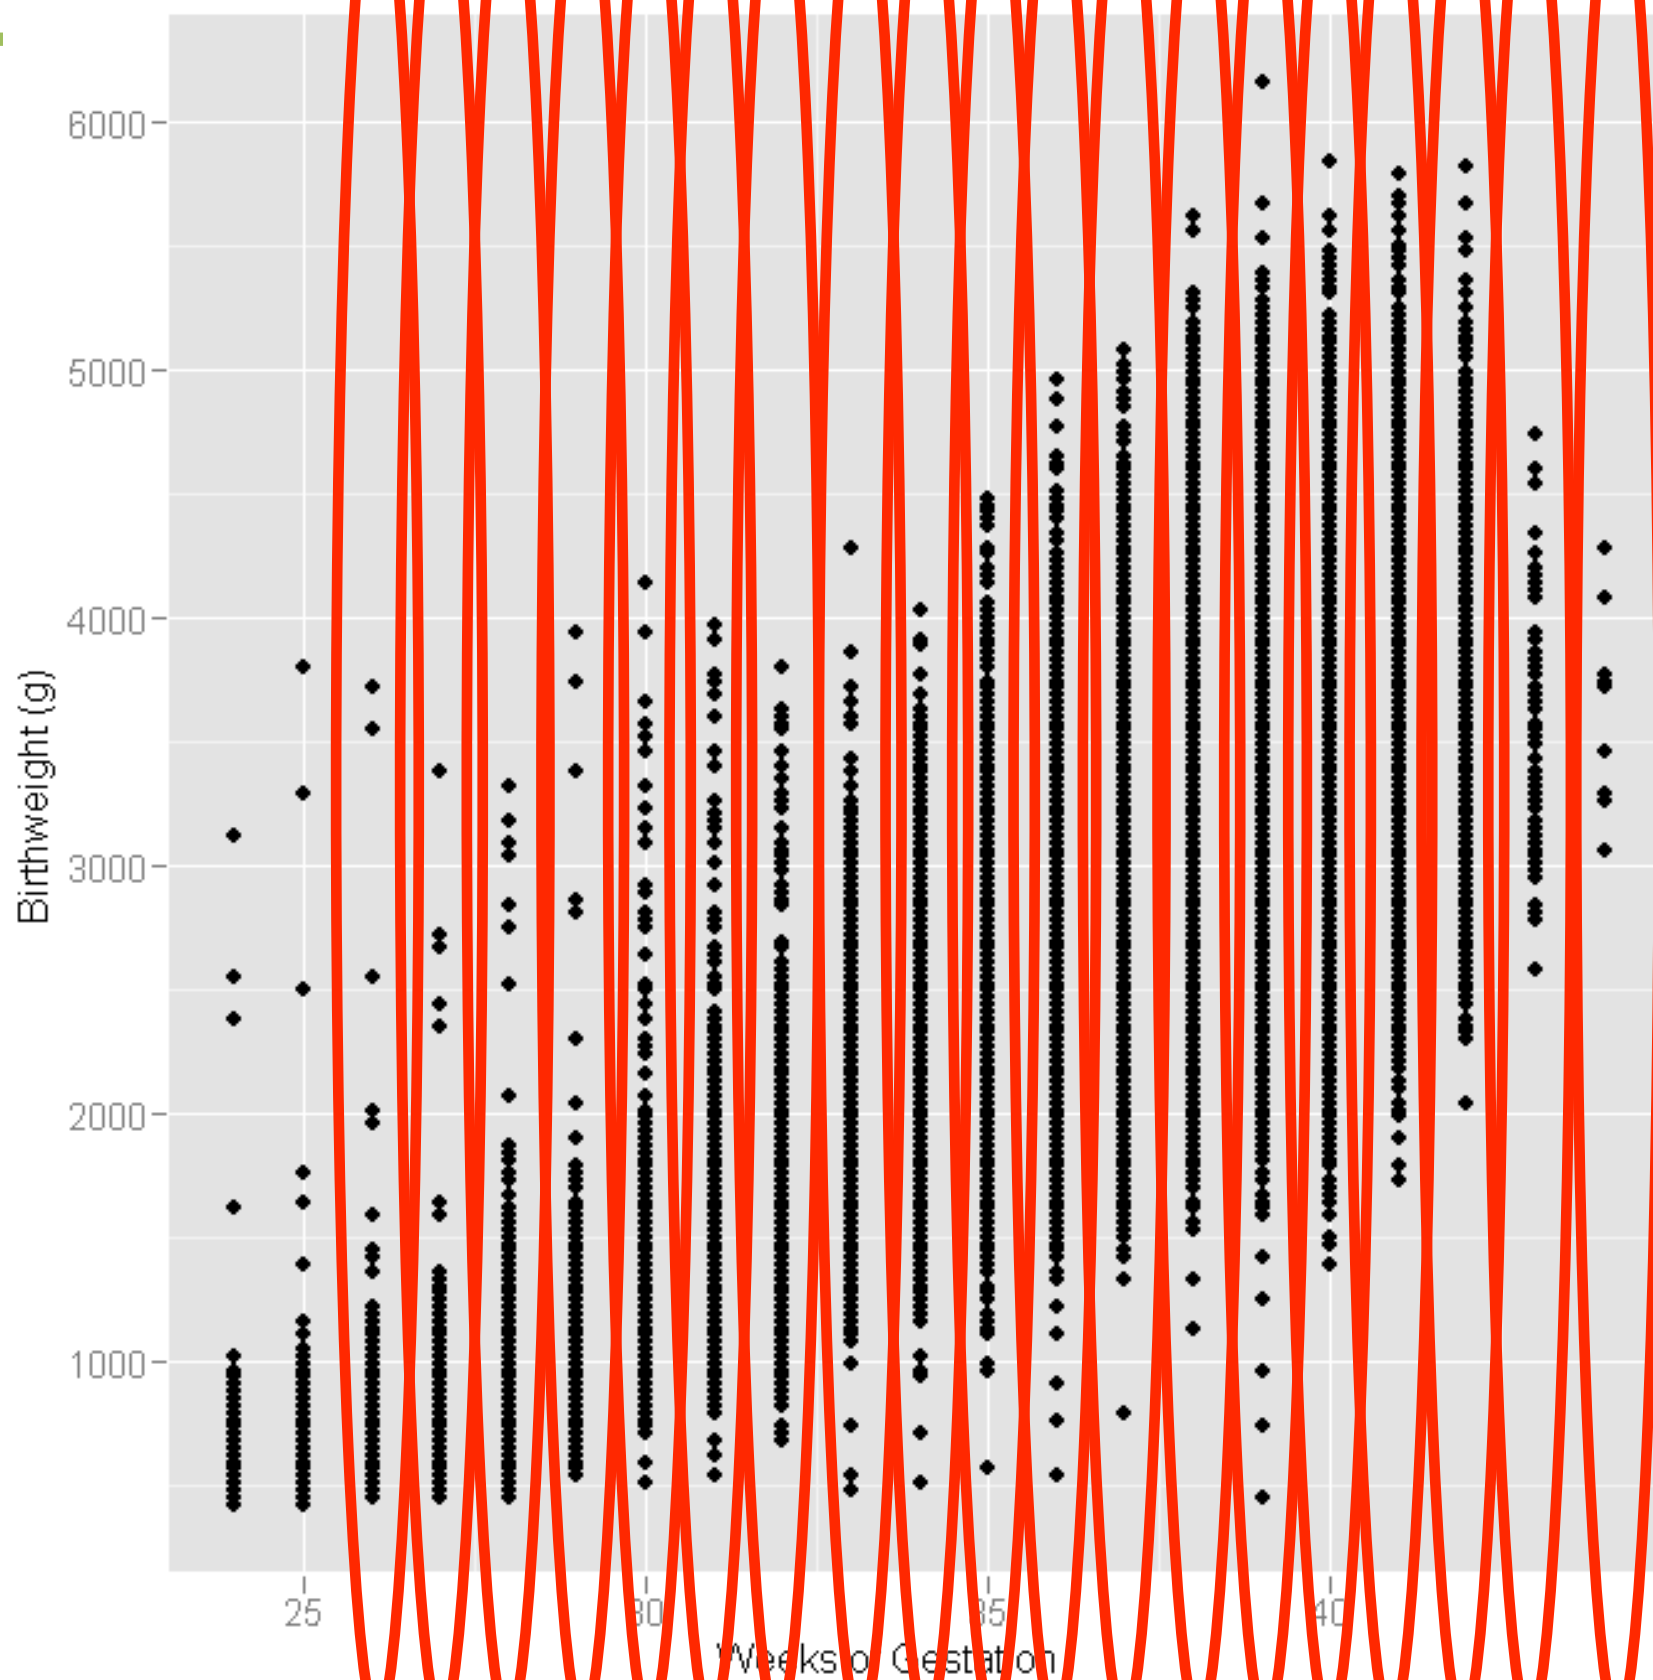

# Weeks of Gestation by Birthweight

# Weeks of Gestation by Birthweight

- Fit regression model for weeks 26 to 42 independently
  - Instead of... $Y = X^T \beta + \epsilon$ , where one beta is Weeks of Gestation (WoG), fit model w/o WoG beta 17 times
- In essence, interacting WoG w/ every other variable
- Similar to Gelman's "secret weapon" idea

## Statistical Modeling, Causal Inference, and Social Science

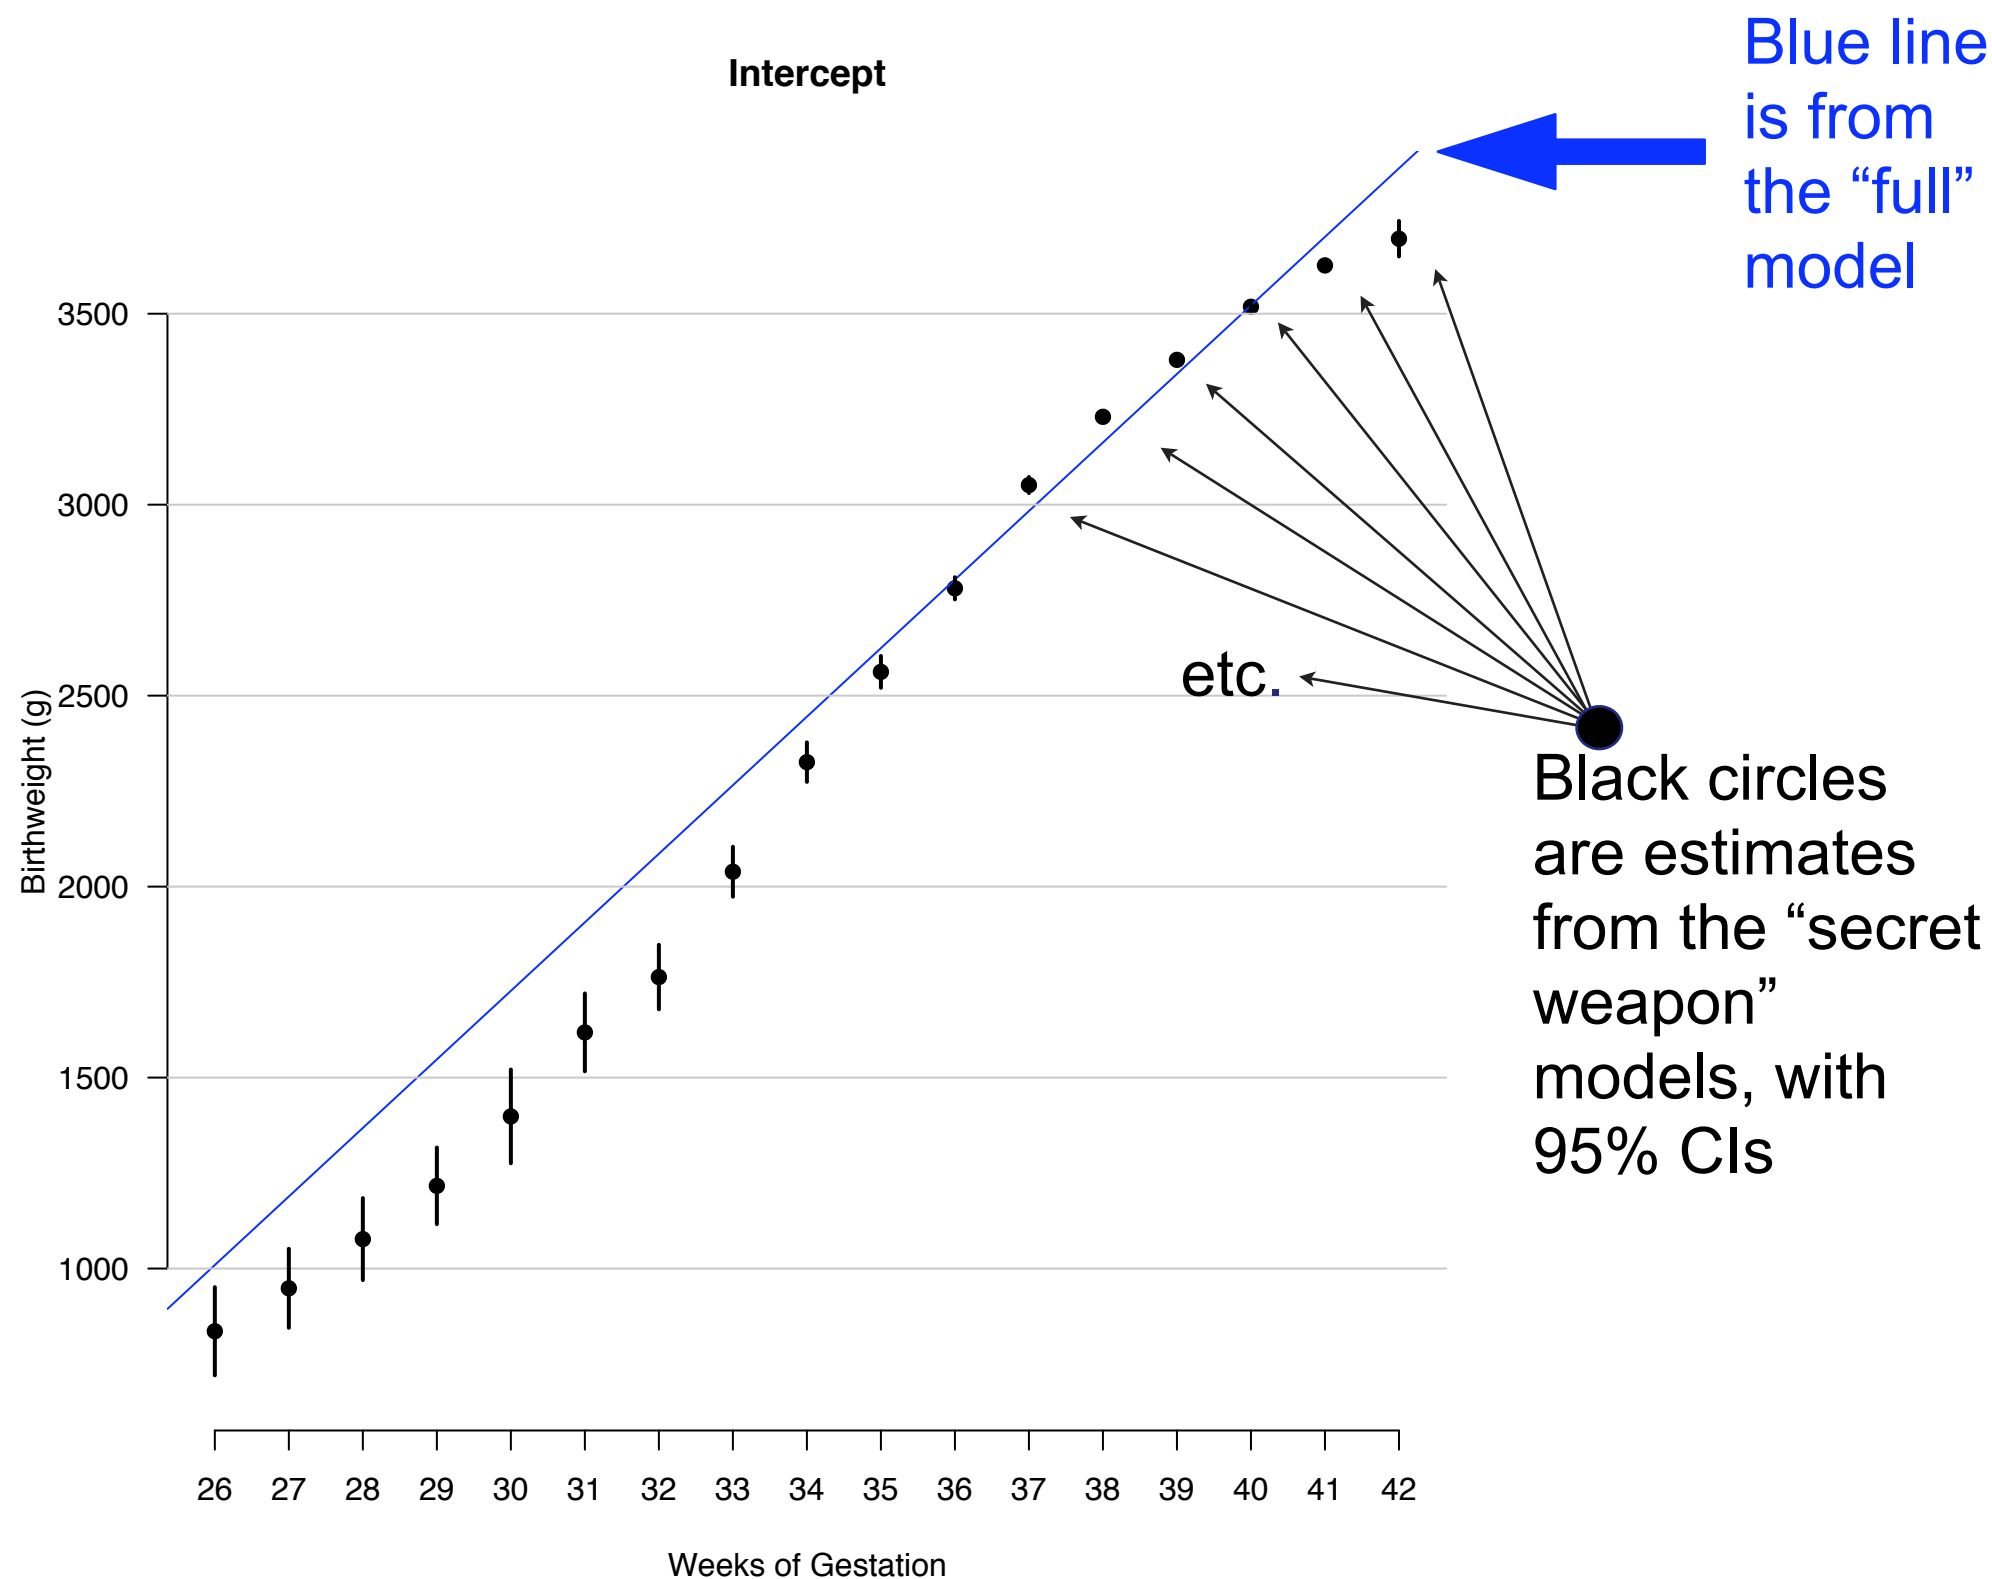

« [Meritocracy won't happen: the problem's with the "ocracy"](#) | [Main](#) | [Still more on R software for matching for causal inference](#) »

**March 7, 2005**

### **The secret weapon**

An incredibly useful method is to fit a statistical model repeatedly on several different datasets and then display all these estimates together. For example, running a regression on data on each of 50 states (see [here](#) as discussed [here](#)), or running a regression on data for several years and plotting the estimated coefficients over time.

# Intercept

## Model “driven by” weeks 34 and up

Histogram of Weeks of Gestation

## Model "driven by" weeks 34 and up

# Effect of Infant's Sex

Again,  
blue line  
is from  
the "full"  
model...

... and black  
circles are  
estimates from  
the "secret  
weapon"  
models, with  
95% CIs

# Effect of Infant's Sex

Again,  
blue line  
is from  
the "full"  
model...

... and black  
circles are  
estimates from  
the "secret  
weapon"  
models, with  
95% CIs

And now, the  
red line is the  
"null value" from  
the standard  
hypothesis test

# Effect of Maternal Tobacco Use

Maternal Tobacco Use

# Effect of Maternal Marital Status

## Unmarried

# Effect of Maternal Age

Maternal Age, 15-19

Maternal Age, 20-24

Maternal Age, 30-34

Maternal Age, 35-39

Maternal Age, 40-44

Age 25-29 is reference group

# Effect of Maternal Education

Maternal Education, 0-8th Grade

Maternal Education, 9th-11th Grade

Maternal Education, Some College

Maternal Education, College Graduate or more

High school educated is reference group

# Effect of Maternal Race, African American

Maternal Race, African American (non-Hispanic)

# Effect of Maternal Race, Hispanic

Maternal Race, Hispanic

# Different Way to View the Results

- So far, results presented in terms of additions or subtractions from the weekly intercept
- Though we do not model differently, we can present results in terms of proportion of each week's intercept
  - A 'relative' adjustment instead of 'absolute'

# Effect of Infant's Sex (relative scale)

# Effect of Maternal Tobacco Use (relative scale)

# Effect of Marital Status (relative scale)

# Effect of Maternal Race, African American (relative scale)

Maternal Race, African American (non-Hispanic)

# Effect of Maternal Race, Hispanic (relative scale)

Maternal Race, Hispanic

## Modification of Model

- **We also extend this approach by making the models not just week-specific but also race-specific**
- **Two caveats:**
  - **1) Could not fit this for Hispanic... small N's**
  - **2) Had to combine upper maternal age range, so now 35-44 (instead of 35-39 and 40-44)**
- **Results focus on just tobacco use for these models**

# Effect of Maternal Tobacco Use by African American Mothers

# Effect of Maternal Tobacco Use by African American Mothers (relative scale)

# Effect of Maternal Tobacco Use by White Mothers

Maternal Tobacco Use

# Effect of Maternal Tobacco Use by White Mothers (relative scale)

## Absolute scale

## Relative scale

Maternal Tobacco Use

Maternal Tobacco Use

Maternal Race  
African American

Maternal Tobacco Use

Maternal Tobacco Use

Maternal Race  
White

## Implications?

- **Factors associated with reduced infant birthweight do not manifest effect until relatively late in gestation**
  - **These associations may differ by race both in terms of impact and timing of impact**
- **Third-trimester fetal surveillance indicated for at-risk populations? Perhaps due to late onset?**
- **Clinical practices?**
- **But how to get at windows of vulnerability? What data?**
  - **This is cross-sectional; seem to need longitudinal, e.g., fetal surveillance**

## Implications?

- **Current variables: Many “fixed” or intrinsic**
  - ... more ‘exposure’ variables, e.g., social stressors?
- **What assumptions do modeling approaches make? Independent subgroups? Does this accord w/ reality?**
- **What about dynamic relationships about subgroups? Implications for subgroup-specific interventions? Unlikely to succeed?**

- Dealing w/ conditioning of the secret weapon
  - Joint distribution of of birthweight, weeks of gestation?

- More formal multilevel modeling
- Multiplicative model for 'relative' changes?
- Spatial?
  - Either Bayesian modeling or simply (first cut?) with a "secret weapon"-like approach

- **Thank you very much!**
