

Mental health in homeless or unstably housed people living with HIV

Daniel P. Kidder, Sherri L. Pals,
& Richard J. Wolitski

The findings and conclusions in this presentation have not been formally disseminated by the Centers for Disease Control and Prevention and should not be construed to represent any agency determination or policy.

Overview

- Many studies have shown that homelessness and mental health problems co-occur.
- Homeless people living with HIV/AIDS (PLWHA) face additional difficulties that may affect their mental health.
- Few studies have investigated mental health among homeless people living with HIV/AIDS.

Study Goal

Investigate mental health status and factors associated with poorer mental health in homeless or unstably housed persons living with HIV/AIDS

Study Overview

- Current study used baseline data from a longitudinal RCT investigating effects of providing housing to homeless or unstably housed people with HIV on health status and HIV risk behaviors.
- Baseline:
 - 644 homeless or unstably housed people across 3 sites (Baltimore, Chicago, Los Angeles)

Participants

- Low income ($\leq 50\%$ median income for area)
- HIV+
- Homeless / Severe risk of homelessness
- At least 18 years old
- Speak English or Spanish
- Able to provide informed consent

Homelessness / Severe Risk of Homelessness

- Homeless
 - In places not meant for human habitation
 - In emergency shelter
 - In transitional / supportive housing for less than 6 months
- Severe Risk of Homelessness
 - Timing (Imminent) and Likelihood (Certainty)
 - Being evicted or losing housing within short period of time (hours or days)
 - Changing residences frequently / overcrowding / doubling
 - Determined case by case

Data Collection

- Computer-based individual interviews
 - Demographics
 - Housing information
 - Health and well-being
 - Social context
 - Sexual behaviors
 - Alcohol and drug use
 - Medical services and adherence to medications
- Biological markers (blood sample)
 - Viral load
 - CD4

Mental Health Measures

- **CES-D**: Center for Epidemiologic Studies – Depression Scale (Radloff, 1977)
 - 10 items, $\alpha = .85$
 - Range: 0 – 30
 - Score ≥ 10 indicates depressive symptoms
- **PSS**: Perceived Stress Scale (Cohen & Williamson, 1988)
 - 10 items, $\alpha = .85$
 - Range: 10 – 50
 - Higher score = Higher perceived stress

Mental Health Measures (cont'd.)

- **MCS: SF-36 Mental Component Summary Scale** (Hays, Sherbourne, & Mazel, 1993)
 - 36 items
 - 8 subscales (physical and mental health)
 - Subscales weighted and summed to create MCS
 - Population normed scale
 - Population mean = 50, SD = 10
 - Lower score = poorer mental health

HIV Risk and Health Measures

- Total number of sex partners, past 90 days
- Unprotected anal or vaginal sex (all partners, all serostatus), past 90 days
- Drug use, past 90 days (used any of 11 drugs)
- Alcohol frequency (≥ 3 drinks more than once a week)
- On highly active antiretroviral therapy (HAART)
- HIV medication adherence, past 2 days
- Regular source of medical care
- CD4
- Viral load
- SF-36 Physical Component Summary Scale

Participant Characteristics

Age (mean)	41
Gender (% male)	68
Race / Ethnicity (%)	
Black	79
Hispanic	9
White	8
Other	4
Education (%)	
< High school	35
High school / GED	29
> High school	36
Marital status (%)	
Never married	69
Married	11
Divorced / Separated	16
Widowed	5

Participant Characteristics (cont'd)

Ever arrested (% yes)	79
Currently working (%)	
No	83
Part-time	12
Full-time	6
Household income, past 30 days (%)	
<\$400	28
\$400 to <\$600	18
\$600 to <\$1000	33
≥ \$1000	21
Income source, past 30 days (%)	
Public only	50
Private only	7
Public and private	42
No identified source	2

Participant Characteristics (cont'd)

Sexual identity (%)	
Heterosexual	52
Gay or lesbian	33
Bisexual / don't know / not sure	6
Homeless past 90 days (%)	27
Ever diagnosed with AIDS (%)	39
Physical abuse, ever (%)	77
Sexual abuse, ever (%)	48

Time Since HIV Diagnosis

- Median = 8 years

CD4+ T Cell Count

HIV Viral Load

* Undetectable

Analyses

1. Descriptive: Mental health status in sample
2. Participant characteristics regression analyses
 - DVs: Each mental health scale
 - What characteristics are significantly associated with mental health controlling for other participant characteristics?
3. Health and HIV risk factors regression analyses
 - DVs: Health and HIV risk factors
 - Are mental health scales associated with health and HIV risk factors when controlling for participant characteristics?

Results

- **CES-D** (≥ 10 indicates depressive symptoms)
 - Mean = 13.73, SD = 7.09
- **PSS** (Range: 10 – 50)
 - Mean = 30.00, SD = 7.38
- **MCS: SF-36** (Pop. norm = 50, SD = 10)
 - Mean = 37.82, SD = 12.88

Sociodemographic Regression Analyses

- Standardized β

	DVs		
	CES-D	PSS	MCS
Housing status Recently homeless: poorer mental health	0.23 **	0.28 ***	0.28 ***
Physical abuse, ever	0.34 ***	0.30 **	0.30 **
Sexual abuse, ever Ever abused: poorer mental health	0.20 *	0.20 **	
Race / Ethnicity (Black v. other) Race other than Black: greater depressive symptoms	0.29 ***		
Age (continuous) Younger: Poorer mental health, higher stress		0.01 *	0.02 ***

Not significant: Marital status, sexual orientation, employment status, education, time HIV-positive, ever diagnosed with AIDS, ever injected drugs

* $p < .05$, ** $p < .01$, *** $p < .001$

Health and HIV Risk Factors Regression Analyses

- DVs: Health and HIV risk factor variables
- Controlled for significant sociodemographic variables from previous analysis
- Mental health variables included as predictor variables

Health and HIV Risk Factors Regressions

- Odds ratios for dichotomous variables, standardized β for continuous

<u>DVs</u>	CES-D	PSS	MCS
On HAART (less depression, less stress)	1.19 *	1.22 *	
Adherent (100%), past 2 days Not adherent: poorer mental health	0.59 **	0.68 ***	0.65 **
Drug use, past 90 days Used drugs: higher stress, poorer mntl hlth		0.84 *	0.80 *
Alcohol frequency More freq.: higher depression, stress	0.72 **	0.74 *	
Unprotected sex (any serostatus) Had unprotected sex: poorer mental health			0.77 **
SF-36 PCS (continuous) Better physical health, better mental health	2.80 ***	2.27 ***	-----

Not significant: Total number of sex partners, unprotected anal/vaginal sex (all partners, neg/unknown status), received any medical care, regular source of medical care, CD4, viral load

* $p < .05$, ** $p < .01$, *** $p < .001$

Conclusions

- Homeless and unstably housed PLWHA report high levels of depressive symptoms, high stress, and poor overall mental health.
- Being recently homeless, having ever been sexually abused, and poorer adherence are associated with poor mental health (all 3 scales).
- More resources should be directed toward addressing the mental health and associated risks of this vulnerable population.
