INTRODUCTION TO THE PROBLEM

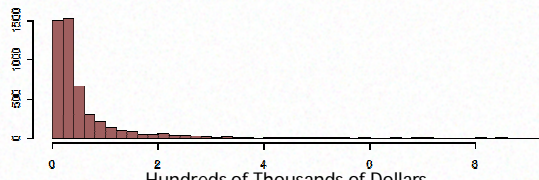

3

APHA 138TH ANNUAL MEETING
NOVEMBER 2010 DENVER, CO

Hospital charges

- Charges are a useful outcome in injury research
- Charges are typically skewed

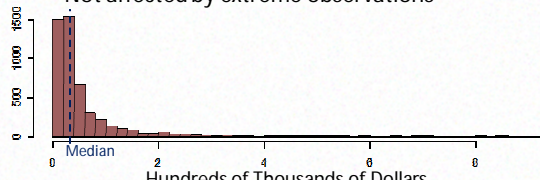

4

APHA 138TH ANNUAL MEETING
NOVEMBER 2010 DENVER, CO

Median Charges

- The sample median is often used to describe charges
 - 50th percentile, or middle observation
 - Not affected by extreme observations

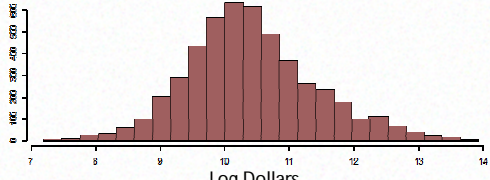

5

APHA 138TH ANNUAL MEETING
NOVEMBER 2010 DENVER, CO

Hospital charges

- Transformed charges are often analyzed

6

Complication: Missing Data

- Administrative hospital datasets often have missing data
- This can be handled using multiple imputation
 - Fill-in missing data with plausible values determined by a statistical model
 - Results in multiple imputed datasets, each with different sets of imputed values
 - Combine results from multiple datasets for final result (Rubin, D.B. 1987)

7

A confidence interval for the Median

A confidence interval for the median can be obtained by:

- Log transformation of the data
- Quantile regression: A non-parametric method combined with bootstrapping

8

Methodological Assumptions

- Transformation Method
 - Assumes that the distribution of charges is normal when transformed
 - Uses the mean and a 95% confidence interval for the mean of the transformed distribution, then back-transform
- Quantile regression
 - No distributional assumptions
 - Uses the sample median and bootstrapping to obtain 95% confidence interval

9

Study Objectives

- Using multiple imputed charges, compare confidence intervals from:
 - Transformation method
 - Quantile regression
- Simulate data from a known distribution
- Apply the methods to an administrative dataset: motor vehicle crash related injuries

10

SIMULATIONS

11

Simulation Methods

Using a known population:

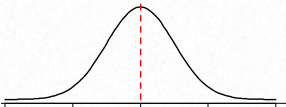

- Sample $n=2000$
- Simulate 10% missing data
- Impute missing data: 5 imputed datasets
- Estimate confidence intervals for the median
- Repeat 100 times
- Compare Mean Square Error, Bias, Coverage, Mean Width of the Confidence Interval

12

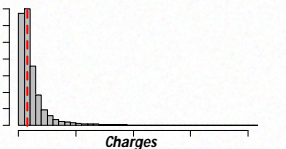

APHA 138TH ANNUAL MEETING
NOVEMBER 2010 DENVER, CO

Simulated Populations

- Population which is normal when log transformed

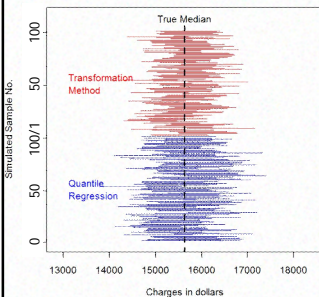

Log Transformed Charges
Median = \$15,636, Variance of log(charges) = 0.88
- Empirical distribution based on observed injury-related charges
 - Utah hospital discharge database (n=112k)
 - Adjusted for inflation

Charges
Median = \$15,636, Variance of log(charges) = 0.88

APHA 138TH ANNUAL MEETING
NOVEMBER 2010 DENVER, CO

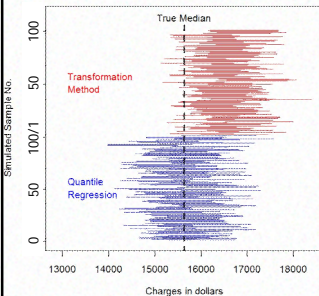

Simulation 1: Normal

Transformation Method	Quantile Regression
MSE	105,990
Bias	\$24
Coverage	95%
Width	\$1,268

APHA 138TH ANNUAL MEETING
NOVEMBER 2010 DENVER, CO

Simulation 2: Empirical

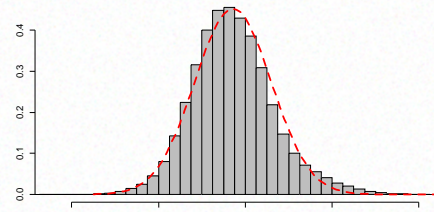

Transformation Method	Quantile Regression
MSE	944,115
Bias	\$900
Coverage	30%
Width	\$1,431

APHA 138TH ANNUAL MEETING
NOVEMBER 2010 DENVER, CO

Simulation 2: Empirical hospital charges

Skewness persists after log transformation:

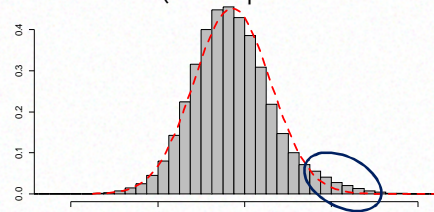

Log Transformed Distribution of Empirical Charges

APHA 138TH ANNUAL MEETING
NOVEMBER 2010 DENVER, CO

Simulation 2: Empirical hospital charges

Skewness persists after log transformation:

- Skewness = 0.41 (0.0 is expected under normality)

Log Transformed Distribution of Empirical Charges

APPLICATION: MOTOR VEHICLE CRASH RELATED INJURIES

APHA 138TH ANNUAL MEETING
NOVEMBER 2010 DENVER, CO

CODES

Crash Outcome Data Evaluation System

- Uses medical outcomes related to motor vehicle crashes (MVC) for highway safety and injury research
- Emergency Department Charges
- Inpatient Hospital Charges
- Multiple imputation accounts for missing data

19

APHA 138TH ANNUAL MEETING
NOVEMBER 2010 DENVER, CO

Motor Vehicle Crash related injuries

- 3 years of inflation-adjusted charges
- Utah dataset
 - Emergency Department (n = 53,950 × 5 imputations)
 - Hospital Inpatient (n = 4,827 × 5 imputations)
- Large multi-state dataset
 - 18 States included
 - Emergency Department (n = 1.37M × 5 imputations)
 - Hospital Inpatient (n = 182,398 × 5 imputations)

20

APHA 138TH ANNUAL MEETING
NOVEMBER 2010 DENVER, CO

Computational Efficiency

Dataset Size	Time to compute	
	Transformation Method	Quantile Regression
n = 4,827 x 5	1 second	4 seconds
n = 1.37M x 5	17 seconds	1.74 hours

- Intel® Core™2 CPU 6600 @ 2.40 GHz, 2.0 GB of RAM
- SAS Procedures: Means (transformation method); Quantreg, MIAnalyze (quantile regression)

21

APHA 138TH ANNUAL MEETING
NOVEMBER 2010 DENVER, CO

Motor Vehicle Crash related injuries

Emergency Department Charges: Median (95% CI)

	Transformation Method	Quantile Regression
Utah	\$763 (757-770)	\$705 (698-712)
Multi-State	\$859 (857-860)	\$826 (825-828)

Inpatient Charges: Median (95% CI)

	Transformation Method	Quantile Regression
Utah	\$32,785 (31,873-33,723)	\$30,138 (29,267-31,009)
Multi-State	\$20,859 (20,724-20,996)	\$19,450 (19,283-19,617)

DISCUSSION

23

APHA 138TH ANNUAL MEETING
NOVEMBER 2010 DENVER, CO

Transformation Method

- Pros
 - Performed well under normality: narrow intervals with good coverage
 - Computationally efficient
- Cons
 - Provided poor coverage in empirical situation
 - Biased: over-estimated the true median
 - Interval estimate of a mean, which may not be equal to the median

24

Quantile Regression Method

- Pros
 - Unbiased estimate with good coverage in both simulations
 - Estimates the median regardless of the shape of the distribution
- Cons
 - Required more computing time
 - Wider confidence intervals under normality

25

Conclusions

- Quantile regression is an unbiased method to obtain confidence intervals for median hospital charges
- Carefully check normality assumptions when analyzing log transformed charges with standard methods
- Quantile regression can be used with multiply imputed charges

26

Future directions

Compare transformation methods to quantile regression for:

- Estimating differences between group medians
- Estimating regression coefficients in multivariable models of the median
