Learning Objective

• Identify the association between widespread implementation of the Ten Steps and infant feeding outcomes
  – In association with a statewide coalition
Background

• Baby-Friendly designated hospitals in 2010
• One of the highest rates of supplementation (CDC report card)-38% in 2008
• CDC CPPW-STI funding permitted organization of a statewide coalition
• The first NJ Baby-Friendly Summit convened to raise awareness of mini-grants for a project to help them become designated

• NJ DOH & AAPNJ established project aims: Baby-Friendly designation in at least 2 out of 10 of the selected hospitals
• Coordinated with NJ State Coalition for steps 3 and 10
• Core team developed plan for recruitment and project design
  – First Statewide Summit
  – First learning session
  – One long action period with monthly TA calls
  – Web sharing
  – Site visits

Methods

• Examined all 10 NJ hospitals participating in an intensive, state-supported program to help hospitals attain Baby-Friendly designation
• Rates of any and exclusive breastfeeding using the NJ Electronic Birth Certificate data before (2010) vs. after (2012) project implementation
• Examined healthy and NICU populations
• Hospitals varied in the number and choice of Steps on which they focused
• Assessed the relationship with breastfeeding rates and the number of Steps mastered.
Methods
Steps Mastered & EBC

• Steps mastered assessed by team lead self-appraisal using a survey modified from the Baby-Friendly USA Self-Appraisal tool and in-depth interviews post-intervention
• Pre—(first quarter 2010) vs. post—(first quarter 2012) overall and exclusive breastfeeding using NJ Electronic Birth Certificate (NJ EBC) data
• NJ EBC defines feeding patterns for the 24 hours before hospital discharge for all newborns in NJ

<td>* Prevalent-risk score is an index composed of birth weight, infant mortality, late prenatal care, and neonatal care. It was used in the grant review process to identify hospitals serving at-risk populations. Scores range from 0 to 5 and the higher the score, the higher the index value and the more at-risk the population. For additional explanation, please see: <a href="http://www.njamps/health/prf/professional/documents/nja_report.pdf">http://www.njamps/health/prf/professional/documents/nja_report.pdf</a></td>

Exclusive Breastfeeding Rates by Steps Achieved, Non-NICU

Exclusive breastfeeding rates among NICU discharges
pre and post intervention by hospital

+ indicates level 2 NICU
Number of Steps Mastered During Project Period ordered by change in % breastfeeding

Hospitals mastered on average 3.7 new steps

Association between Steps mastered during intervention period and change in exclusive breastfeeding among healthy term newborns, by hospital

Association between total number of Steps in place at the end of the project, and exclusive breastfeeding among healthy infants, by hospital
Limitations

• Only 10 of the 52 delivery hospitals were included in the project
• Hospitals were not randomly selected
• There were no control hospitals
• No comparisons made to other NJ hospitals
• Hospitals self-assessed their status in implementation of the Ten Steps

CONCLUSIONS

• Statewide coalition expedites BFHI designation and progress through 4-D
• Any and exclusive breastfeeding increased among healthy and sick newborns
• Increase in breastfeeding correlated with the number of Steps mastered

"Well done is better than well said."
– Benjamin Franklin

Acknowledgments

• Collaborators: AAPNJ PCORE, NJDHSS-ONF-ShapingNJ, CPPW-STI, NJ DOH-Family Services and Division of Epidemiology and Biostatistics
• NJ BFHI Coalition Hospitals and Key Contacts
• The project was supported in part by a cooperative agreement with the Centers of Disease Control and Prevention (#3U58DP002002-0152), and funded by a grant from the New Jersey Department of Health, Office of Nutrition and Fitness. Portions of this project’s work involve the Communities Putting Prevention to Work initiative supported by CDC funding.
