No Relationships to Disclose
Introduction

- Suicide is the 3rd leading cause of death among Hispanic males aged 15 to 34

- Experiences of race-based discrimination are associated with depression and suicidal ideation

- Research Question: Do experiences of racial discrimination increase the risk of attempting suicide among Hispanic males?

Hypothesized Causal Structure

- Racial Identity
- Age
- Income
- Education
- Marital Status
- Urbanicity
- Region of the U.S.

EXPERIENCES OF RACIAL DISCRIMINATION → SUICIDE ATTEMPTS

MEDIATOR: Depression?
Methods

**Data Source:** National Epidemiological Survey on Alcohol and Related Conditions [NESARC] Wave 2 (2004-2005)

**Sample Size:** 2,618 Hispanic males

**Key Measures:**
- Lifetime suicide attempts (self-reported)
- Lifetime experiences of racial discrimination (self-reported)
- Lifetime depression (AUDADIS)

**Statistical Analysis:** Logistic regression with and without depression in the model

---

**Domains of Discrimination**

1. Ability to obtain health care
2. Treatment from health care providers
3. In public: streets, stores, restaurants
4. Other: jobs, school, courts, police, housing
5. Being called a racist name
6. Made fun of, picked on, pushed/shoved, hit or threatened with harm

---

**Graphs showing the distribution of discrimination experiences among suicide attempters and non-attempters.**
Experiences of Racial Discrimination in the NESARC

Results: Logistic Regression

Controlling for the following covariates: age, income, education, marital status, region of the U.S., urbanicity, and racial identity.

Limitations

**Cross-sectional data:** These data do not establish temporality between racial discrimination, depression and suicide attempts. Each measure is a lifetime self-report. Therefore, there is the potential for reverse causation – though unlikely.

**Recall bias:** We used lifetime measures for racial discrimination, depression, and suicide attempts

**Experiences of discrimination scale:** Study cannot address the potentially important distinction between perceptions and/or experiences of race-based discrimination and attempted suicide.
What might explain these results?

- Direct pathways from experiences of racial discrimination to attempting suicide NOT mediated by depression
  - Ex: Acculturative Stress

- Depression may precede experiences of discrimination
  - Cannot tease out – cross-sectional

Implications of this Research

A better understanding of how experiences of race-based discrimination potentially influence individual suicidal behavior may help clinicians identify symptoms that are predictive of suicide attempts among adult Hispanic males, especially if the mechanisms linking discrimination and suicide don’t include depression.
Thank you!
