Research objectives:
1. Classify socio-demographic characteristics of LHD leaders by examining the variation in openness to change score.
2. Characterize association between accreditation status of LHD and leader openness to change.

Data and Methods:
• A cross-sectional survey of KY LHD leaders.
• Actual expenditures and revenues from state health department and county level population estimates from the national census website.
• To identify differences in ACQ score the Wilcoxon-Mann-Whitney and Kruskal Wallis non-parametric tests are used.

Instrument:
Q1. There is really something refreshing about enthusiasm for change.
Q2. If I were to follow my deep convictions, I would devote more time to change movements. This seems to me to be a primary need today.
Q3. The current situation in the community calls for change; we should do something now (we must respond at once).
Q4. If you want to get anywhere, it's the policy of the system as a whole that needs to be changed, not just the behavior of isolated individuals.
Q5. Any organizational structure becomes a deadening weight in time and needs to be revitalized.

Principal Findings:
• LHD leaders had a generally high openness to change score.
• Statistically significant variations in rank ACQ score distributions by gender, highest degree obtained and accreditation status are present.

Implications for Public Health Policy:
• Public Health leadership development programs will benefit from preparing leaders to modify their behaviors so as to recognize the complex interactions between individual leader and agency characteristics.
