UNIVERSITY of the  
WESTERN CAPE

# Introduction

- Maternal mortality and severe morbidity are currently major problems in reproductive health worldwide
- South African maternal mortality rate is 175-200/100 000 live births
- Recognising consumer perceptions of healthcare services and incorporating the client's views to improve quality of care is widely acknowledged in healthcare

# Study sites

# Research Problem

# Aim & Objectives

## **AIM**

To determine factors that impact on the utilisation of maternal care

## **OBJECTIVES**

- To identify the predictors of utilisation of maternal services
- To assess and compare the quality of maternal care services from the perspective of the women
- To compare the differences in the utilisation of maternal care services across sites
- To compare health seeking behaviour of HIV positive and HIV negative mothers

# Research Methodology

- Sample : 20 HIV+, 20 HIV- & 20 HIV-unknown status, randomly sampled from prior study or community lists in each site
- Cross sectional study
- Data collection
  - *Semi-structured home-based interviews with mothers who have delivered a baby in the last 9-12 months*
  - *Questionnaire – adapted from WHO Safe Motherhood Needs Assessment*

# Score Development and Data Analysis

- Scores were developed on perceived quality, knowledge, socio-economic status, satisfaction and barriers to services variables
- Scores were developed with the help of an expert in public health
- The Kruskal-Wallis test was used to assess the differences in the scores across sites
- Correlation analysis was used to assess the relationship between the indicator scores
- Simple linear regression analysis was used to assess individual predictors of utilisation

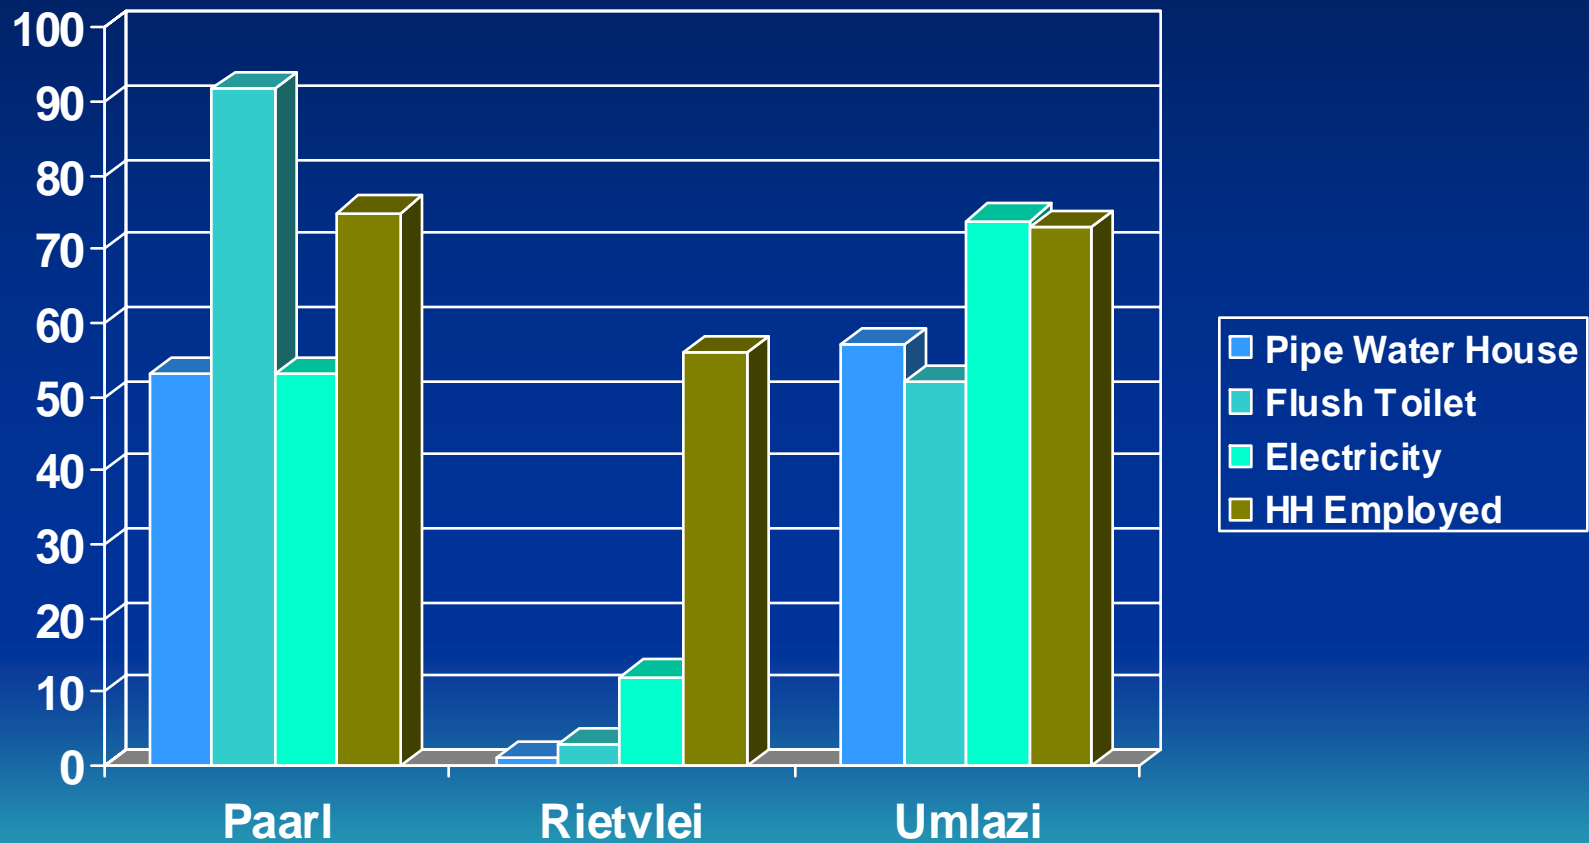

# Development of utilisation score

Variable	Categories Response	Score
ANC attendance in all pregnancies	Yes	1
	No	0
Place of delivery in all pregnancies	In health centre	1
	Not in health centre	0
First antenatal care visit	0-4 months	1
	> 4 months	0
First infant follow-up visit	0-6 weeks	1
	> 6 weeks	0
First mother follow-up visit	0-6 weeks	1
	> 6 weeks	0
Currently using family planning	Yes	1
	No	0

# Study Results

## Socio-Demographics

# Descriptive statistics for the scores

**\*\*These variables come from items in the WHO Safe Motherhood Needs Assessment**

Score Variable	N	Mean	Std	Min	Max
Socio-economic status	177	11.85	5.83	1	25
Utilisation of services	178	4.51	1.05	1	6
Barriers to services	178	3.43	1.83	0	8
Perceived quality of services**	178	12.98	5.76	1	25
Satisfaction with services**	178	3.63	1.40	0	6
Knowledge of danger signs**	178	47.31	24.07	10	122

# The correlations among the scores

	Coefficients				
	Quality	Knowledge	Socialscore	Barriers	Satisfaction
Quality	1				
Knowledge	-0.071	1			
Socialscore	0.148	-0.030	1		
Barriers	-0.068	0.030	-0.067	1	
Satisfaction	0.489	-0.134	-0.148	0.038	1

# Predictors of utilisation of maternal services

Scores	R-square	Pr >  t
Perceived quality	0.214	<0.0001
Knowledge of danger signs	0.068	0.0004
Socio-economic status	0.049	0.0030
Barriers to maternal services	0.045	0.0043
Satisfaction	0.022	0.0504

# Distribution of utilisation score by site

# Comparisons of score variables in all sites

Scores	Paarl	Rietvlei	Umlazi	P-value
Socio-economic status	13	6	14	<0.0001
Utilisation of services	5	3	4	<0.0001
Barriers to services	2	3	2	0.4253
Perceived quality of services	17	9	12	<0.0001
Satisfaction with services	4	4	3	<0.0001
Knowledge of danger signs	31	45	52	<0.0001

# Utilisation of maternal health services by HIV status

- Utilisation of maternal health services was not determined by HIV status
- The utilisation of services by HIV+ and HIV- women is worrying because HIV+ women are at higher risk of complications

# Conclusions

- *Perceived Quality of Care is the strongest predictor of maternal health service utilisation – clients are more informed than we think??*
- Development of score variables from WHO Safe Motherhood Needs Assessment Tool may have wide applicability for assessing maternal health services
- The factors contributing to poor utilisation of services pose serious threats to women's health in Rietvlei and Umlazi
